### Résumé :

Ce compte-rendu présente le résultat de plusieurs missions botaniques ayant eu lieu sur l'île de Crète à différentes périodes de l'année. Il fait suite à un précédent rapport (BOUCHET, 2016) traitant de la même région. Les espèces sont présentées par site géographique en mettant en avant les espèces endémiques et patrimoniales. Ces voyages ont permis notamment de découvrir une nouvelle espèce pour la Crète, *Viola kitaibeliana* Schult, et de nouvelles stations d'espèces peu répandues. Une mise à jour des principaux syntaxons a été réalisée et fait l'objet d'un paragraphe. Enfin, une analyse des endémiques et espèces patrimoniales est présentée en fin de rapport.

### Abstract :

This account presents the results of several botanical trips which took place on the island of Crete at different periods of the year. It follows a former report of this region (BOUCHET, 2016). Species are presented for each location and with special emphasis on endemic species and species of conservation concern. Thus during these trips a new species for Crete is discovered, *Viola kitaibeliana* Schult, as well as new locations of uncommon species. A high-rank syntaxonomy update is also presented. Then an analysis of endemic species and species of conservation concern is made.

## • Introduction

This account presents the results of several botanical trips which took place on the island of Crete at two different periods of the year: 8 to 13 April and 14 to 22 October 2018. It follows a former report of this region (BOUCHET, 2016) involving the same team and thus gives additional information as well as a phytosociological review. Only the western part of the island was visited in spring to complete the former report. Then a visit in autumn on the whole island was an opportunity to observe different species or species at a different stage of their annual cycle. The aim of these trips was to discover the Aegean flora and vegetation, in particular endemic species of the island as well as species of conservation concern. The identification of the species was possible thanks to the Atlas of the Aegean Flora (STRID, 2016a & 2016b) and Flora Europaea (TUTIN *et al.*, 1964-1980). Syntaxa nomenclature follows MUCINA *et al.* (2016) or WAGENSOMMER (2017) as far as thermophilous rocky plant communities are concerned.

Most of the island is made of limestone and dolomite. The climate is considered as mild and Mediterranean with four distinct seasons. Winter is rainy and mild while summer is warm and dry. However, due to its extraordinary geographical and ecological diversity, the island which is extremely mountainous presents a great variety of climates depending on the region and location. Annual rainfall never exceeds 620 mm on the shore while it can reach 1,000 mm and more in the mountains (BARBERO & QUEZEL, 1980). According to EMBERGER (1930), the climate can be considered as varying from arid to humid with intermediate situations, i.e. semi-arid and sub-humid.

The nomenclature of taxa follows that of the Atlas of the Aegean Flora (STRID, 2016a).

Species recorded are presented site by site hereafter.

Rocky area on Korokos peninsula  
(*verbasco arcturi-Campanulion creticae*)

- **Detail report**

## Falassarna

Our first stop was at the westernmost part of the island, in Φαλάσαρνα (Falassarna). This area is rocky with sparse vegetation called phrygana dominated by evergreen Mediterranean shrubs.

Falassarna

- *Anthemis rigida*;
- *Ballota pseudodictamnus*;
- *Bupleurum gracile*;
- *Calicotome villosa*;
- *Carlina corymbosa*;
- *Cheilanthes acrostica*;
- *Cichorium spinosum*;
- *Convolvulus oleifolius*;
- *Crepis neglecta*;
- *Daucus guttatus*;
- *Drimia maritima*;
- *Ebenus creticus* (endemic to Crete);
- *Erica manipuliflora*;
- *Galactites tomentosus*;
- *Genista acanthoclada*;
- *Hyoseris scabra*;
- *Inula candida*;
- *Lagurus ovatus*;
- *Lamyropsis cynaroides*;
- *Malcolmia flexuosa*;
- *Malva parviflora*;
- *Medicago disciformis*;
- *Muscaria spreitzenhoferi* (endemic to Crete);
- *Notobasis syriaca*;

*Ballota pseudodictamnus*

*Parietaria cretica*

- *Onopordum bracteatum*;
- *Ornithogalum collinum*;
- *Parietaria cretica*;
- *Phagnalon rupestre subsp. graecum*;
- *Phlomis fruticosa*;
- *Picris pauciflora*;
- *Pistacia lentiscus*;
- *Plantago coronopus*;
- *Rhamnus lycioides subsp. oleoides*;
- *Sarcopoterium spinosum*;
- *Satureja thymbra*;
- *Scrophularia heterophylla*;
- *Sedum litoreum*;
- *Smilax aspera*;
- *Thymbra capitata*;
- *Tordylium apulum*;
- *Trifolium nigrescens*;
- *Urospermum picroides*;
- *Valantia hispida*;
- *Valantia muralis*.

## Falassama

Further north, in Χερσόνησος Κώρυκος (Korikos peninsula), we discovered a typical example of the *Verbasco arcturi-Campanulion cretiae* community, an endemic rocky alliance, including the following species:

- *Arabis verna*;
- *Ballota pseudodictamnus*;
- *Delphinium staphysagria*;
- *Euphorbia dendroides*;
- *Origanum dictamnus* (endemic to Crete);
- *Orobanche pubescens*;
- *Petromarula pinnata* (endemic to Crete);
- *Scrophularia peregrina*;
- *Stachys spinulosa*.

The plateau is covered with a phrygana dominated by *Genista acanthoclada* and *Ballota pseudodictamnus* but also by open swards mainly composed of annual species:

- *Biscutella didyma*;
- *Campanula erinus*;
- *Knautia integrifolia* subsp. *mimica*;
- *Linum pubescens* subsp. *sibthorpiatum*;
- *Moraea mediterranea*;
- *Nigella damascena*.

## Omalos Viannou

We then headed to Ομαλός Βιάννου (Omalos Viannou), a Natura 2000 site and an area bounded by the Omalos Viannou mountain plain and the Erganos stream to the north, and the southern peaks of Dikti to the south. This is where we found Mediterranean ponds at an elevation of 1,060 m. The most characteristic vegetation community was the *Isoetion* surrounded by other accompanying species:

Mediterranean pond in Omalos Viannou (Isoetion)

- *Berberis cretica*;
- *Eleocharis palustris*;
- *Isoetes hystrix*;
- *Ranunculus lateriflorus*;
- *Ranunculus peltatus*;
- *Romulea bulbocodium*;
- *Scilla nana* (endemic to Crete).

*Isoetes hystrix*

*Ranunculus peltatus*

## Xyloskalo

Further south-east, on the way to the Samaria Gorge, we toured around the Ξυλόσκαλο resort (Xyloskalo). This was the perfect place to discover the open mountainous woodland dominated by the Mediterranean Cypress (*Cupressus sempervirens*) and the Cretan Maple (*Acer sempervirens*) belonging to the *Berberido creticae-Juniperion foetidissimae* community. It was also one of the rare locations where *Zelkova abelicea* was to be found: this is the only endemic tree species of the island.

Here are the few species we were able to discover:

- *Acer sempervirens*;
- *Astragalus depressus*;
- *Cupressus sempervirens*;
- *Cynosurus effusus*;
- *Orchis pauciflora*;
- *Saxifraga rotundifolia*;
- *Zelkova abelicea* (endemic to Crete).

In rocky ground some species relying to the xeric oromediterranean calcicolous cushion-tragacan-thic scrub of western Crete (*Verbascion spinosi*) also occurred:

- *Aethionema saxatile* subsp. *graecum*;
- *Aubrieta deltoidea*;
- *Verbascum spinosum* (endemic to Crete).

*Acer sempervirens*

Another conspicuous species was to be found on the Omalos mountain plain in spring: *Tulipa bakeri*, an endemic species, though possibly a stabilised hybrid.

*Aubrieta deltoidea*

## Akrotiri peninsula

Back on the lowland, we crossed the Χερσόνησος Ακρωτήρι (Akrotiri peninsula), north east of Χανιά (Chania) to the Ιερά Μονή Καθολικού (Katholiko monastery). Going down the trail to the beach, we crossed amazing gorges with a high diversity of rocky plant species belonging to the *Verbasco arcturi-Campanulion cretiae*, the typical low-elevation rocky community of western Crete:

- *Achillea cretica*;
- *Anchusella variegata*;
- *Anogramma leptophylla*;
- *Bellium minutum*;
- *Brassica cretica* subsp. *cretica* (endemic to Crete);
- *Crupina crupinastrum*;
- *Ebenus cretica* (endemic to Crete);
- *Enarthrocarpus arcuatus*;
- *Ephedra foemina*;
- *Helichrysum orientale*;
- *Inula candica* (endemic to Greece)
- *Lactuca acanthifolia*;
- *Lamyropsis cynaroides*;
- *Matthiola incana*;
- *Petromerula cretica* (endemic to Crete);
- *Rosularia serrata*;
- *Scutellaria sieberi* (endemic to Crete);
- *Silene sedoides*;
- *Symphytum creticum* (endemic to Greece);
- *Valerianella echinata*;
- *Verbascum arcturus* (endemic to Crete).

## Kalami

On the northern coast, west of Καλάμι (Kalami), at the bottom of a cliff, several species drew our attention:

- *Achillea cretica*;
- *Ferulago nodosa*;
- *Galium fruticosum* (most probably endemic to Crete);
- *Hypericum empetrifolium*;
- *Lathyrus annuus*;
- *Nepeta scordotis* (endemic to Crete);
- *Teucrium divaricatum*.

## Rodopos peninsula

Our next destination was Χερσόνιος Ροδοπού (Rodopos peninsula).

This is where we found *Solenopsis minuta* subsp. *annua*: this plant is mostly found on western Crete (endemic) (CRESPO *et al.*, 1998). It is one of the species that could be associated to the *Adiantetea* community.

*Solenopsis minuta* subsp. *annua*

Further north, along Ὄνυχας Ὁπος (Mount Onichas), we crossed lowland phrygana.  
Here are some more species occurring in the peninsula:

- *Adonis cretica* (endemic to the S Aegean area);
- *Arenaria muralis*;
- *Arum concinnum*;
- *Calicotome villosa*;
- *Centaurea argentea* (endemic to Crete and Kithira);
- *Coronopus squamatus*;
- *Crepis pusilla*;
- *Crepis tybakenensis* (endemic to Aegean Islands);
- *Cynara cornigera*;
- *Daucus guttatus*;
- *Ferulago thrysiflora* (endemic to Crete);
- *Genista acanthoclada*;
- *Mentha pulegium*;
- *Nepeta melissifolia* (endemic to Crete);
- *Ptilostemon chamaepeuce*;
- *Sagina apetala*;
- *Thymbra capitata*;
- *Trifolium resupinatum*;
- *Trifolium tomentosum*;
- *Valeriana asarifolia* (endemic to the S Aegean area);
- *Verbascum macrurum*.

*Adonis cretica* - Photo J.-P. Brizard

*Ferulago thrysiflora* - Photo L. Teulade

## Chania beach

Sandy coast in Chania - Photo L. Teulade

Sandy coasts have a very specific flora. Actually, the psammophytic vegetation in Crete is patchy and fragmentary. It belongs to the *Ammophilion* Br.-Bl. 1921 community: the *Agropyron-Diotis* group was the name provisionally proposed by ZOHARY & HORSHAN (1965). Here is the composition of this community on Chania beach:

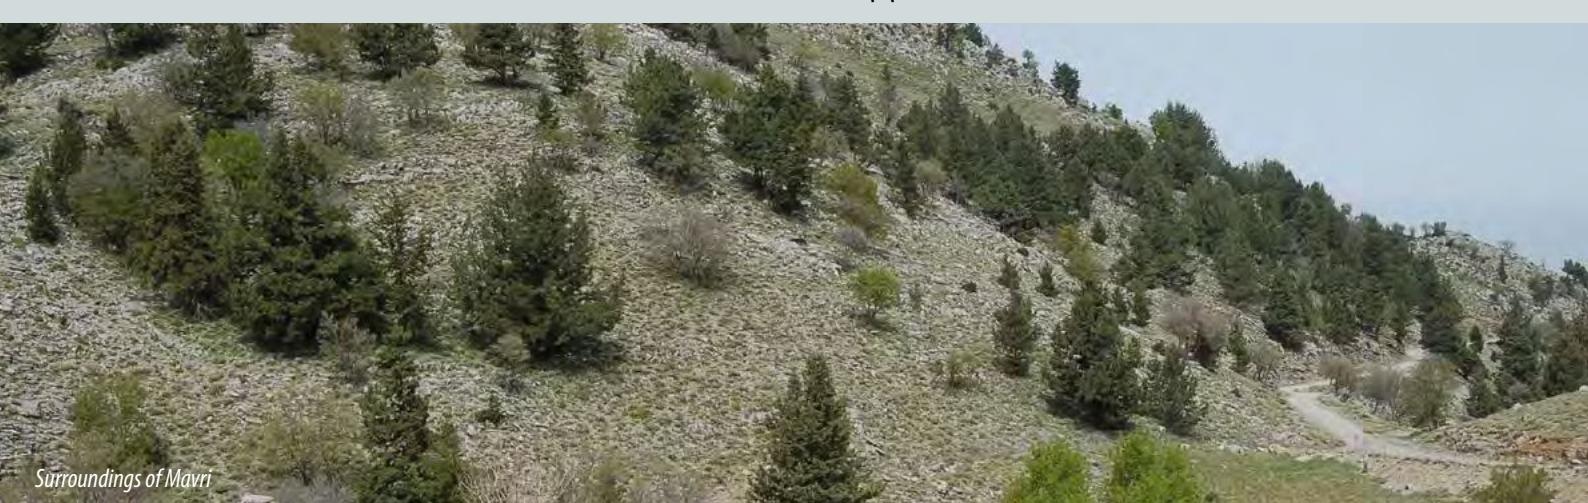

- *Allium commutatum*;
- *Centaurea spinosa*;
- *Cutandia maritima*;
- *Cyperus capitatus*;
- *Eryngium maritimum*;
- *Medicago marina*;
- *Otanthus maritimus*;
- *Pancratium maritimum*;
- *Pseudorlaya pumila*;
- *Silene colorata*;
- *Thymelaea hirsuta*.

*Cyperus capitatus*

## Mavri

Our next destination was a mountainous area inland south of Chania called Maúpn (Mavri).

Surroundings of Mavri

Here we found upper level communities of the *Rhamno lycoidis–Quercetum cocciferae* community as mentioned by TSIOURLIS *et al.* (2009). More interestingly this is the place where we discovered *Viola kitaibeliana*: this is the first record of the species on the island as confirmed by STRID (pers. comm.). *Viola kitaibeliana* is widespread on mainland Greece and also found on a few other islands including Lesvos but had never been recorded in Crete before.

- *Acer sempervirens*;
- *Acinos alpinus*;
- *Arabis auriculata*;
- *Aristolochia sempervirens*;
- *Arum creticum*;
- *Asphodelina lutea*;
- *Cardamine graeca*;
- *Cupressus sempervirens*;
- *Dryopteris pallida*;
- *Erica arborea*;
- *Gagea amblyopetala*;
- *Lamium garganicum* subsp. *striatum*;
- *Orchis pauciflora*;
- *Orchis quadripunctata*;
- *Orchis tridentata*;
- *Paeonia clusii* (endemic to the Dodecanese and Crete);
- *Saxifraga rotundifolia* subsp. *chrysosplenifolia*;
- *Scilla nana* (endemic to Crete);
- *Viola kitaibeliana* (new for Crete).

## Gorge Therisiano

Back to the north we stopped in the Θερισιανό Φαράγγι (Gorge Therisiano) where chasmophytic species occur, including many endemic species. It is also one of the rare locations where the Holm Oak (*Quercus ilex*) is to be found on the island:

- *Arenaria muralis*;
- *Brassica cretica* subsp. *cretica* (endemic to Crete);
- *Centaurea argentea* (endemic to Crete and Kithira);
- *Centaurea redempta* (endemic to Crete);
- *Ceratonia siliqua*;
- *Cionura erecta*;
- *Crepis tybakkensis* (endemic to Aegean Islands);
- *Ferulago thysiflora* (endemic to Crete);
- *Galium fruticosum* (most probably endemic to Crete);
- *Lactuca acanthifolia*;
- *Legousia pentagonia*;
- *Melica uniflora*;
- *Origanum dictamnus* (endemic to Crete);
- *Petromarula pinnata* (endemic to Crete);
- *Quercus ilex*;
- *Salvia fruticosa*;
- *Scutellaria sieberi* (endemic to Crete);
- *Securigera globosa* (endemic to Crete);
- *Staehelina petiolata* (endemic to Crete);
- *Teucrium divaricatum*.

## Sougia harbour and Lissos

Then we headed to the south coast between Λιμάνι Σούγιας (Sougia harbour) and Λίσσος (Lissos). We first went up a canyon to a plateau before going down to a small beach.

The rocky low-altitude vegetation belongs to the *Verbascum arcturus-Campanulion cretiae* community:

- *Anthyllis hermanniae*;
- *Ballota pseudodictamnus*;
- *Capparis spinosa*;
- *Caucalis platycarpos*;
- *Centaurea argentea* (endemic to Crete and Kithira);
- *Convolvulus althaeoides*;
- *Dracunculus vulgaris*;
- *Ebenus creticus* (endemic to Crete);
- *Euphorbia dendroides*;
- *Ferulago thyrsiflora* (endemic to Crete);
- *Galium fruticosum* (most probably endemic to Crete);
- *Gagea graeca*;
- *Inula candida* (endemic to Greece);
- *Lamyropsis cynaroides*;
- *Lithodora hispidula* subsp. *hispidula* (endemic to the S. Aegean area);
- *Ophrys sphegodes*;
- *Origanum dictamnus* (endemic to Crete);
- *Petromarula pinnata* (endemic to Crete);
- *Phlomis fruticosa*;
- *Pinus brutia*;
- *Prasium majus*;
- *Ranunculus asiaticus*;
- *Ranunculus creticus*;
- *Salvia pomifera*;
- *Salvia viridis*;
- *Scutellaria sieberi* (endemic to Crete);
- *Securigera cretica*;
- *Securigera parviflora*;
- *Serapiss lingua*;
- *Serapiss vomeracea*;
- *Silene behen*;
- *Stachys spinosa* (endemic to Greece);
- *Stachys spinulosa*;
- *Staelhelina fruticosa* (endemic to the S Aegean area);
- *Tamus communis*;
- *Trifolium grandiflorum*;
- *Valeriana asarifolia* (endemic to the S Aegean area);
- *Verbascum arcturus* (endemic to Crete);
- *Vitex agnus-castus*.

*Stachys spinosa*

*Lissos*

## Lefka Ori

The next destination took us to one of the highest mountains of the island: the Λευκά Όρη (Lefka Ori meaning «White Mountain»), the highest point reaching 2,454 m. Above 1,400 m of elevation, vegetation communities are dominated by the *Saturejo spinosae-Scutellarietalia hirtae* community which is an order endemic to Crete. Many species were recorded on this picturesque site:

Lefka Ori

- *Acantholimon androsaceum* (endemic to Crete);
- *Anchusa cespitosa* (endemic to Lefka Ori);
- *Anthemis rigida*;
- *Asplenium aegeum*;
- *Astragalus angustifolius*;
- *Buferina stricta* (endemic to Greece);
- *Centaurea idaea* (endemic to Crete);
- *Colchicum cretense* (at high altitude) (endemic to Cretan mountains);
- *Colchicum pusillum* (at low altitude);
- *Crepis sibthorpiana* (endemic to Crete);
- *Crocus laevigatus* (endemic to Greece);
- *Dianthus sphacioticus* (endemic to Lefka Ori);
- *Draba cretica* (endemic to Cretan mountains);
- *Erica manipuliflora*;
- *Euphorbia herniariifolia*;
- *Helianthemum hymettium* (endemic to Greece);
- *Helichrysum italicum*;
- *Hypericum empetrifolium* subsp. *tortuosum* (endemic to Crete);
- *Lomelosia sphaciotica* subsp. *sphaciotica* (endemic to Lefka Ori);
- *Ormosolenia alpina*;
- *Paronychia macrosepala*;

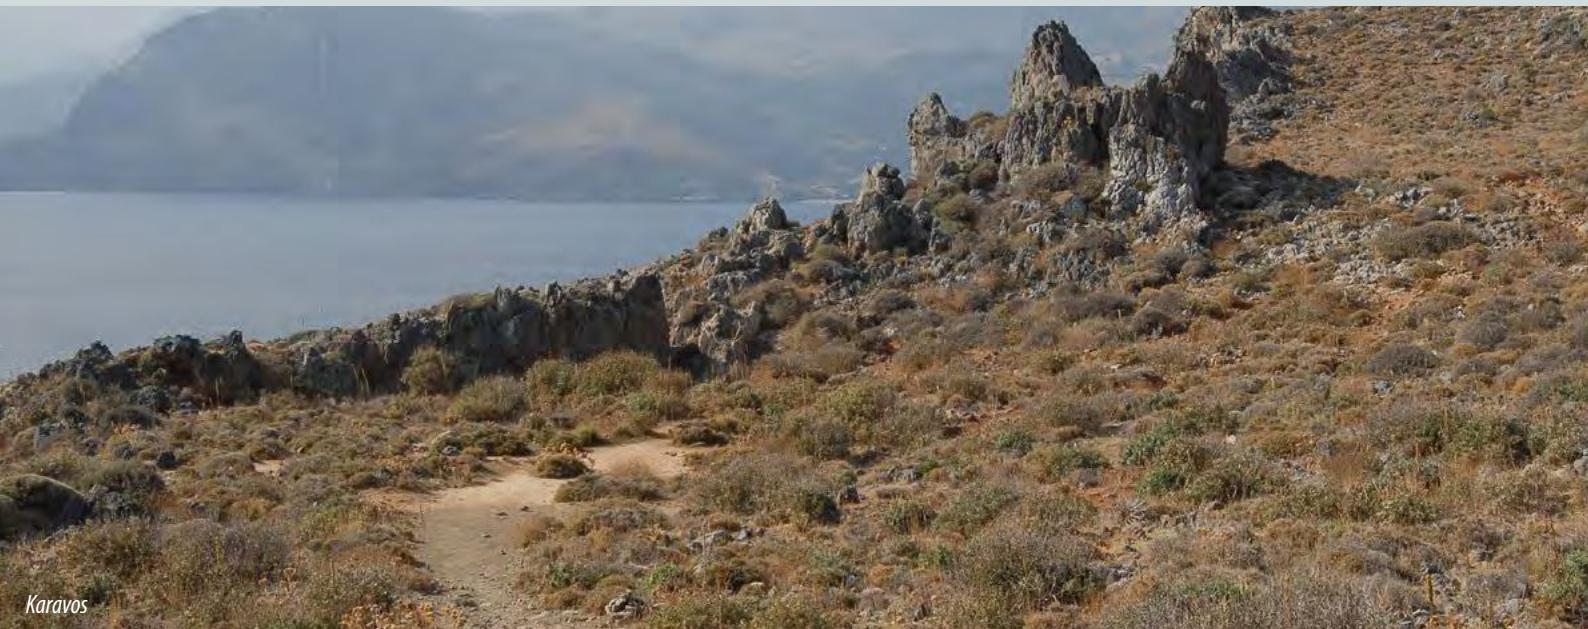

- *Petrorhagia illyrica* subsp. *taygetea* (endemic to Greece);
- *Ranunculus bullatus*;
- *Satureja thymbra*;
- *Scilla autumnalis*;
- *Scutellaria hirta* (endemic to Crete);
- *Sternbergia lutea* subsp. *greuteriana*;
- *Taraxacum megalorhizon*;
- *Thesium bergeri*;
- *Thymbra capitata*;
- *Verbascum spinosum* (endemic to Crete);
- *Veronica thymifolia* (endemic to Greece).

## Karavos and Plakias

On the southern coast, autumn is the right time to discover species of the *Cichorio spinosi-Limonion roridi* (BRULLO *et al.*, 2017) community growing on rocky coasts. This is what we recorded in Κάραβος (Karavos):

Karavos

- *Capparis spinosa*;
- *Dianthus fruticosus* subsp. *creticus* (endemic to Crete);
- *Limonium roridum*.

Further west and south of Πλακιάς (Plakias) extends a small peninsula covered with phrygana:

- *Biarum davisii* (endemic to Crete);
- *Carlina gummosa*;
- *Convolvulus dorycnium* subsp. *dorycnium*;
- *Daphne gnidioides*;
- *Euphorbia acanthothamnos*;
- *Euphorbia characias*;
- *Euphorbia dendroides*;
- *Inula crithmoides*;
- *Lamyropsis cynaroides*;
- *Phlomis cretica*;
- *Phlomis fruticosa*;
- *Prasium majus*;
- *Sarcopoterium spinosum*.

*Dianthus fruticosus* subsp. *creticus*

*Limonium roridum*

*Daphne gnidioides*

## Gious Kampos

On our way to Ψηλορείτης (the Mount Ida), we stopped in Γιους Κάμπος (Gious Kampos) to discover another endemic crocus: *Crocus oreocreticus*.

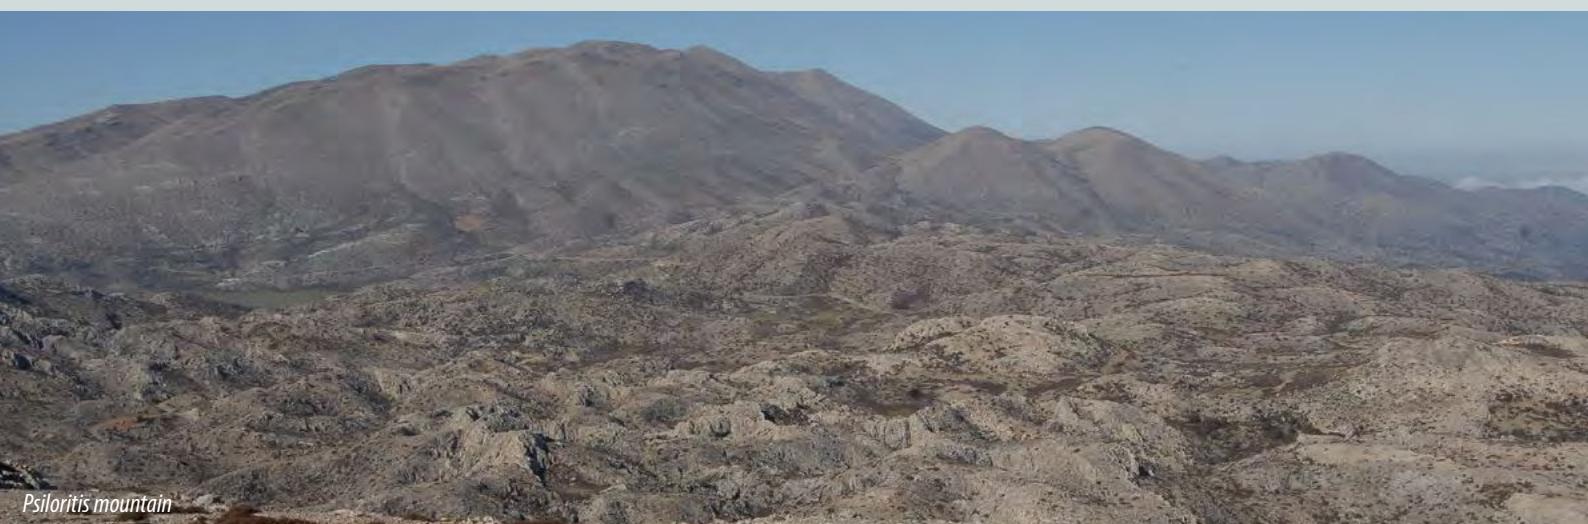

Gious Kampos

## Psiloritis mountain

The Psiloritis mountain (Mount Ida) in central Crete includes the highest point of the island reaching 2,456 m high.

Psiloritis mountain

This is where we discovered the *Astragalion cretici* community which extends from central to eastern Crete at high altitude:

- *Acantholimon androsaceum* (endemic to Crete);
- *Acinos sp.*;
- *Anthemis abrotanifolia* (endemic to Crete);
- *Asparagus aphyllus*;
- *Asplenium scolopendrium* subsp. *antri-jovis*;
- *Astragalus angustifolius*;
- *Astragalus creticus* subsp. *creticus*;
- *Astragalus depressus*;
- *Atriplex patula*;
- *Berberis cretica*;
- *Bolanthus creutzburgii* subsp. *creutzburgii* (endemic to Crete);
- *Centaurea idaea* (endemic to Crete);
- *Colchicum cretense* (endemic to Cretan mountains);
- *Crocus laevigatus* (endemic to Greece);
- *Crocus oreocreticus* (endemic to Crete);
- *Cystopteris fragilis*;
- *Phlomis lanata* (endemic to Crete);
- *Pimpinella tragium*;
- *Polygonum idaeum* (endemic to Crete);
- *Silene antri-jovis* (endemic to Crete);
- *Sternbergia lutea*;
- *Teucrium alpestre* (probably endemic to Crete);
- *Viola alba* subsp. *cretica* (endemic to Crete).

## Elounda saltmarshes

Elounda shore

Back to the northern coast, we stopped in Σχίσμα Ελούντας (Elounda) saltmarshes. This is a place where the *Salicornietea* community is to be found, even if this class is poorly represented:

- *Beta vulgaris* subsp. *adanensis*;
- *Cressa cretica*;
- *Halimione portulacoides*;
- *Mesembryanthemum nodiflorum*;
- *Salicornia europaea*.

*Cressa cretica* and *Halimione portulacoides* are not mentioned here in the Atlas of the Aegean flora (STRID, 2016). So, these species could have been recorded for the first time in Elounda saltmarshes.

*Salicornia europaea*

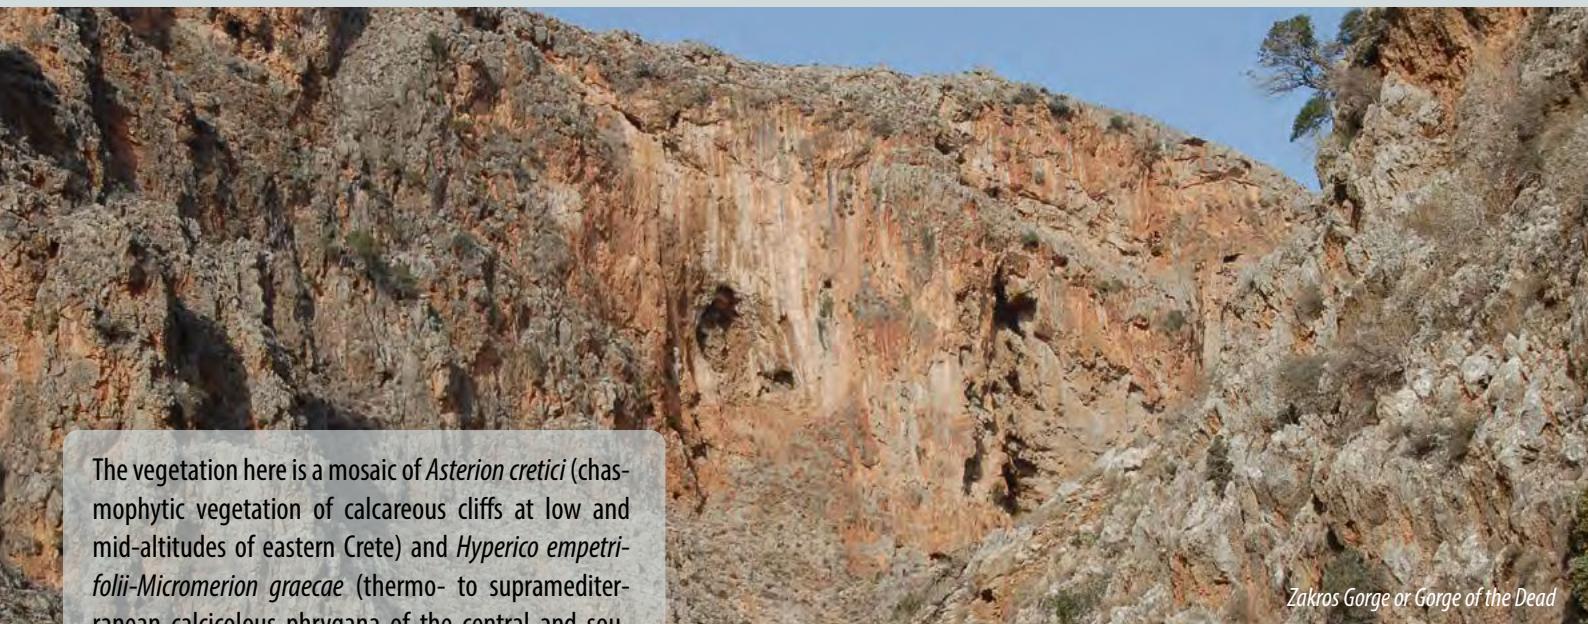

*Cressa cretica*

## Kato Zakros

Our final destination was Kάτω Ζάκρος (Kato Zakros) on the eastern part of the island. This site is a rocky and narrow valley passing through hills.

The vegetation here is a mosaic of *Asterion reticulatum* (chasmophytic vegetation of calcareous cliffs at low and mid-altitudes of eastern Crete) and *Hyperico empetrifolii-Micromerion graecae* (thermo- to supramediterranean calcicolous phrygana of the central and southern regions of Hellas, the Aegean region and Crete). Here are some of the species recorded:

- *Capparis spinosa*;
- *Cynara cornigera*;
- *Delphinium staphysagria*;
- *Dianthus fruticosus* subsp. *sitiacus* (endemic to Crete);
- *Euphorbia characias*;
- *Euphorbia dendroides*;
- *Helichrysum orientale*;
- *Hypericum empetrifolium*;
- *Linum arboreum*;
- *Origanum onites*;
- *Phillyrea media*;
- *Phlomis* sp.;
- *Ruta chalepensis*;
- *Satureja thymbra*;
- *Scorzonera* sp.;
- *Stachys spinosa* (endemic to Greece);
- *Staelhelina fruticosa* (endemic to the S Aegean area);
- *Thymbra capitata*.

In the gravelly bed of the watercourse, it is interesting to notice the abundance of *Nerium oleander* and *Vitex agnus-castus*.

*Satureja thymbra*

*Staelhelina fruticosa*

Riverbanks with *Vitex agnus-castus*

## • Synthesis and Analysis

### New species and new records for the island

During these trips one species new for the island was discovered as confirmed by A. STRID (pers. comm.):

- *Viola kitaibeliana* Schult

This South Eurasian species was known from most of Greece including Thasos, Agios Evstratios, Samothraki, Alonnisos, Kira Panagia, Gioura, Skanzoura, Skiros, Lesvos, Evvia, Andros, Tinos, Ikaria and Kalimnos. So, this species is new for the whole South Aegean area even if species widespread in Peloponnissos could usually extend to western Crete. Furthermore, it must be pointed out that this is the southernmost location this species has yet been recorded in the Aegean islands.

The following map shows the distribution of the species across the Aegean area according to the Flora Hellenica Database dated 5.10.2018 and provided by STRID.

Historically, only *Viola rauliniana*, a close-related taxon was recorded in Crete (ERBEN, 1985). This latter species is clearly different, having even smaller flowers, entire leaves and reduced stipules. *V. rauliniana* is mainly a species of thorncushion communities in the Cretan mountains, whereas *V. kitaibeliana* occurs in a variety of semi-natural habitats at lower altitude (STRID, pers. comm.)

This population was discovered in the *Rhamno lycoidis–Quercetum cocciferae* community in semishaded conditions at an elevation of 1,180 m in Mount Mavri.

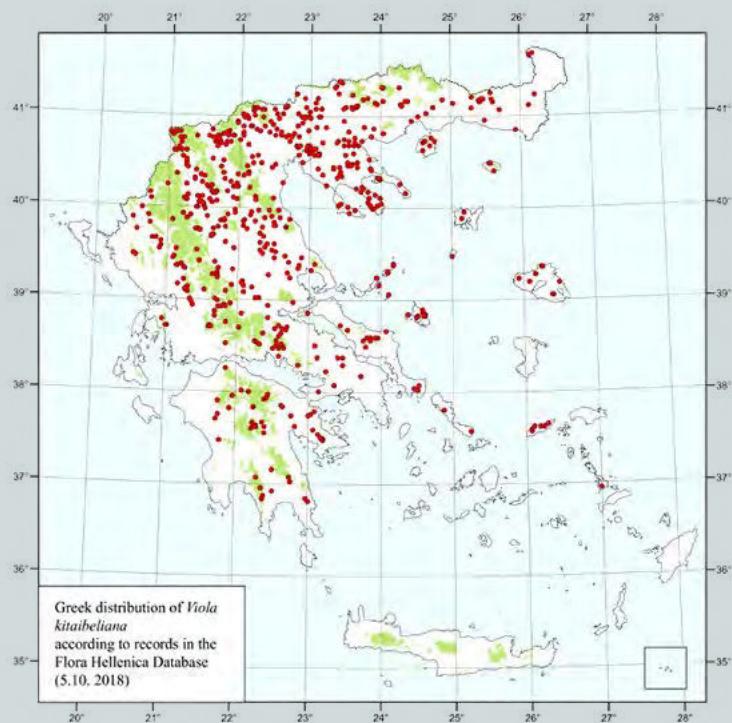

Consequently, the species has been added to the Flora Hellenica database.

Two more species were recorded in Elounda saltmarshes for the first time:

- *Cressa cretica* L. ;
- *Halimione portulacoides* (L.) Aellen

These two species grow in saltmarshes and are scattered on the island.

*Cressa cretica* has only been recorded on the eastern half of Crete along the shore while *Halimione portulacoides* grows on the northern and the eastern coast of the island.

## • The high-rank syntaxa of Crete

This report is an opportunity to update the high-rank syntaxa classification on the island taking into account the last papers and syntheses available:

**MOLINIO-ARRHENATHERETEA** Tx. 1937

In order to have a general overview of the island here is a map of the vegetation  
(from KYPRIATOKIS et al., 1996):

-  Cultivation & phrygana
-  Phrygana
-  Maquis & Oak forests
-  Pine & Cypress forests
-  Subalpine shrubland

## • Endemism

Here is an interesting table (modified and enhanced from JAHN, 2003) giving an interesting analysis of the Cretan vascular flora and also highlighting the endemic species and subspecies (updated from JAHN & SCHÖNFELDER, 1995).

	All taxa		Endemic taxa		Endemic subspecies of non endemic species	
	Number	Percentage	Number	Percentage	Number	Percentage
<b>Species</b>	1,890	94.5	165	8.2		
<b>Subspecies</b>	111	5.5	9	0.5		
<b>Total</b>	2,001	100	174	8.7	33	1.6

The number of endemic species of Crete increases in the mountains, above 1,400 m, due to high geodiversity and more or less constant long-term climatic conditions that enhance their role as refuges for relict taxa (JAHN, 2003). At this level, endemism may reach 25% to 31% of the total flora. Species numbers of mountain endemics decline from west to east due to a decrease in area and altitude of the mountain ranges. They remain low on elevations of 1,000 to 1,200 m, where the natural timberline is not reached. Numbers of lowland endemics are highest in the well isolated Sitia peninsula, on the eastern part of Crete.

A more recent paper (MENTELI *et al.*, 2019, update from FIELDING *et al.*, 2005) assesses the total amount of endemic species and subspecies to 223 but the proportions given in the table are most probably still valid.

The total number of endemic taxa recorded during those trips was 48. Additionally, few more species endemic to the Southern Aegean area, to Crete and Cyprus or to Greece were recorded (see appendix 1).

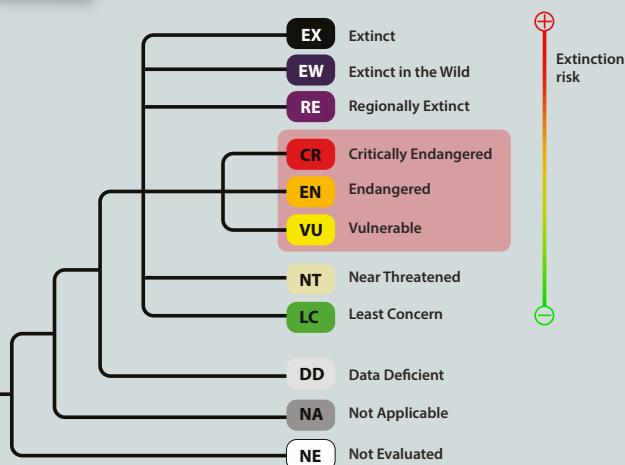

As for vegetation communities, few of them are also endemic to the island:

- *Verbasco arcturi-Campanulion cretiae all. nov. prov.*
- *Saturejo spinosae-Scutellarietalia hirtae* Dimopoulos *et al.* ex Bergmeier 2002 (including three alliances).

## • Species and natural habitats of conservation concern

Red lists are inventories of the conservation status of plant and animal species throughout the world, as directed and compiled by scientists and conservationists. The IUCN Red List of Threatened Species is the world's most comprehensive inventory of the global conservation status of species. It uses a set of quantitative criteria to evaluate the extinction risk of thousands of species. These criteria are relevant to most species and all regions of the world. With its strong scientific base, The IUCN Red List is recognised as the most authoritative guide to the status of biological diversity. There are eight IUCN Red List Categories based on criteria linked to population trend, size and structure, and geographic range. Species listed as Critically Endangered (CR), Endangered (EN) or Vulnerable (VU) are collectively described as threatened. Two red lists were checked in this report with respect to the geographic area studied: the IUCN European Red List (BLITZ *et al.*, 2011) and the Red Data Book of rare and threatened plants of Greece (PHITOS *et al.*, 2009).

Taxon	Family	European IUCN status	Greek IUCN status and main causes of decline	Range	Comments
<i>Bolanthus creutzburgii</i>	<i>Caryophyllaceae</i>	—	Main threat is overgrazing, particularly in summer. <b>VU</b>	Endemic to Cretean mountains: Lefka Ori and Psiloritis	Occurs between 1,550 m and 2,100 m high At least 8 sub-populations
<i>Phoenix theophrasti</i>	<i>Palmaceae</i>	—	As far as the tourism is respectful, it could survive. Recent changes in land management could also damage the population. <b>VU</b>	Endemic to Crete	The largest known Greek population stands in Vai, a touristic area. It has been declared an «Aesthetic Forest Preserve» in the late 1970s, and its core area was effectively protected by fencing in spring 1983. The preserve area covers 20 ha
<i>Zelkova abelicea</i>	<i>Ulmaceae</i>	<b>EN</b>	Overgrazing and browsing by goats and sheep. Livestock destroy seedlings and saplings hindering the species' development to fruiting and they also cause soil erosion by trampling. Fires are also a major threat to the Zelkova trees.	Endemic to Crete	There may be thousands of dwarf individuals found on the island of Crete but only very few stands of mature trees have survived and these are severely fragmented.

Endemic taxa are highlighted in the table featured in the appendix 1. Among them two are of conservation concern as «vulnerable» according to the Red Data Book of Greece and one is of conservation concern as «endangered» according to the European Red List.

The total amount of taxa recorded is 394. Among them 48 are endemic to Crete and 21 more are near-endemic or endemic to Greece (see appendix 1). Two endemic syntaxa were also recorded.

Furthermore, the Phoenix Palm tree grove is a priority habitat of the Habitats Directive 92/43/EEC. This site located in Vai (Eastern Crete) was featured in the former report (BOUCHET, 2016).
